# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/GB2004/000229

## Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
  
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-12

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-12

A luminescent device comprising a gaseous tritium light source (GTLS) which provides a light output of pre-determinable intensity. Further, a casing, its materials, filter and colouring means for the device.

---

2. claims: 13-15

A kit comprising two ore more luminescent (GTLS) devices, whereby each light output is of distinct intensity. A magnetic handling tool.

---

3. claims: 16,17

A light measuring apparatus comprising a luminescent (GTLS) device housed in a sample holder of an apparatus as e.g. a luminometer, flourometer, spectrophotometer, etc.

---

4. claims: 18,19

A method of analysing a sample comprising the steps of using an GTLS device to calibrate an apparatus able to detect a light output, and inserting a sample into the apparatus and obtaining a reading therefore. The sample comprises living cells.

---

(54) Title: LUMINESCENT DEVICE

(57) Abstract: The present invention provides a luminescent device (1) comprising a gaseous tritium light source (GTLS) (3). The GTLS (3) is held within a housing (2) which may optionally be located in an outer casing. A filter, such as a neutral density filter, may be used to modify the light output to predetermined levels. The device may be used to calibrate apparatus used to measure optical output, such as a luminometer.

WO 2004/065511 A2

1     Luminescent Device

2

3     The present invention relates to a luminescent  
4     device comprising a gaseous tritium light source.  
5     The device may be used, for example, to calibrate  
6     luminometers and other scientific apparatus  
7     measuring optical output.

8

9     Different types of scientific apparatus may be used  
10    to measure optical readings and frequently find  
11    utility in chemistry, biochemistry, biotechnology  
12    and medicine. Such optical readings are an  
13    effective, reliable and safe method for detection  
14    and analysis of molecules and living cell dynamics.  
15    Luminometers are one example of such scientific  
16    apparatus, and are used to measure the luminous  
17    output or luminescence of samples. The luminometer  
18    is based on a light-sensitive device termed a  
19    photomultiplier.

20

1 Other examples of light measuring equipment include  
2 a CCD (Charge Coupled Device) camera based imaging  
3 device such as the "Berthold Night Owl", a  
4 scintillation counter, photomultiplier, a  
5 fluorometer, a spectrophotometer and a photodiode  
6 (in particular an avalanche photodiode).

7  
8 It is important that apparatus reliant on optical  
9 analysis is regularly calibrated to ensure  
10 consistency of results. Current optical apparatus  
11 calibration devices may comprise a plurality of  
12 light emitting diodes of varying intensities. The  
13 apparatus is calibrated by checking that the  
14 reading of the apparatus corresponds to the known  
15 intensity of the light emitted from each of the  
16 light emitting diodes. Such calibration is also  
17 important when cross-referencing results from  
18 different machines.

19  
20 These known calibration devices are expensive, and  
21 require a power source. This renders them  
22 relatively untransportable. The known calibration  
23 devices are also bulky and occupy the entire sample  
24 space allocated in the apparatus. Thus during  
25 calibration of the apparatus, testing must be  
26 stopped to insert the calibration device into the  
27 apparatus. It is not therefore possible to check  
28 the calibration of the machine whilst measuring  
29 test samples. There is thus a risk that the  
30 accuracy of the apparatus may decrease between  
31 calibrations, i.e. during testing, so that test  
32 results may be less accurate than is desirable.

1 WO 94/05983 discloses a multi-photomultiplier which  
2 utilises a radioactive material to provide a light  
3 output. Each photomultiplier component of the  
4 multi-photomultiplier described in WO 94/05983 is  
5 calibrated against another photomultiplier in the  
6 same multi-photomultiplier.

7  
8 According to a first aspect of the present  
9 invention there is provided a luminescent device  
10 comprising a gaseous tritium light source (GTLS)  
11 which provides a light output of pre-determinable  
12 intensity.

13  
14 Tritium ( $^3\text{H}$ ) is a radioactive gas that emits  
15 electrons which produce light through scintillation  
16 when they collide with a phosphor substance.  
17 Tritium has a half-life decay of (12.43 +/- 0.05)  
18 years and after this time the activity of the  
19 tritium source (and thus its luminescence) is  
20 decreased by half. The intensity of the light  
21 output will slowly decrease over time in accordance  
22 with this half-life decay. As the date of  
23 manufacture of the luminescent device is known, the  
24 half-life correction may be accurately calculated.  
25 The half-life correction may be calculated by means  
26 of a computer programme or from a half-life graph.

27  
28 Thus, in contrast to WO 94/05983 discussed above,  
29 the present invention relates to a device where a  
30 gaseous tritium light source provides a light  
31 output of predeterminable intensity. The equipment  
32 to be tested is compared to a light source of pre-

1 determinable intensity rather than being tested  
2 relative to another photomultiplier.

3

4 Preferably a number of distinct devices according  
5 to the present invention are provided, each  
6 providing a different pre-determinable light  
7 intensity. This facility for having a range of  
8 different pre-determinable light outputs is  
9 especially useful in the calibration of scientific  
10 apparatus measuring optical output, for example a  
11 luminometer, and enables calibration of the  
12 apparatus across the whole required range of light  
13 intensity. To achieve reduced light intensity, the  
14 device of the invention may comprise a light  
15 filtering means which predeterminably alters the  
16 intensity of the light output to produce a reduced  
17 light output. Suitable light reducing means  
18 include a neutral density filter, and the use of  
19 differing neutral density filters (e.g. of 1.0  
20 giving 10% transmission; 2.0 giving 1%  
21 transmission) allowing the luminescence of the  
22 device to be reduced by a predetermined amount.  
23 Desirably the light outputs are selected to test  
24 the accuracy of the apparatus across the whole  
25 range of light intensity measurable. Where a  
26 luminometer is to be calibrated using one or more  
27 devices according to the present invention,  
28 preferably the device or devices will test the  
29 accuracy of the luminometer from at least 400 to  
30 650 nm, suitably from at least 450 to 610 nm.

31

1 The luminescent device is desirably small enough to  
2 be housed in a sample holder of the scientific  
3 apparatus (e.g. luminometer, fluorometer,  
4 spectrophotometer, CCD camera, photodiode (like an  
5 avalanche photodiode), photomultiplier,  
6 scintillation counter or the like).

7  
8 Preferably the luminescent device is shaped and  
9 sized to be suitable for insertion into an  
10 individual well of a standard size well plate, for  
11 example a 96, 384 or 1536 well plate. As the  
12 luminescent device of the present invention is  
13 small enough to be housed in a single well of a  
14 sample holder of a luminometer or other scientific  
15 apparatus measuring optical output, it is possible  
16 for the luminescent device to be left in the  
17 apparatus during use, even when other wells contain  
18 test materials.

19  
20 The calibration of the scientific apparatus can  
21 therefore be checked for accuracy at each instance  
22 of use of the luminescent device of the present  
23 invention.

24  
25 The luminescent device of the present invention may  
26 typically comprise the GTLS sealed in a housing  
27 which is not easily broken under normal working  
28 conditions. Suitably the housing is shatter, heat,  
29 cold and moisture resistant. Whilst the housing  
30 may be formed of any suitable material, examples  
31 include aluminium, brass, steel, plastics (e.g.  
32 polypropylene, acrylics and the like), carbon fibre

1 and ceramics. However at least one portion of the  
2 inner housing will usually be transparent or  
3 translucent (i.e. permits transmission of  
4 luminescence) and is unreactive to tritium.  
5 Mention may be made of glass (for example sapphire  
6 glass), plastic or a combination of these  
7 materials. Alternatively, the housing may include  
8 an aperture through which the light output is  
9 measured. In this embodiment, the GTLS will be  
10 retained within the housing by a suitable means,  
11 e.g. snug fit of the GTLS within the inner surface  
12 or, more usually an adhesive material and generally  
13 an outer casing including a transparent or  
14 translucent portion will be present.

15  
16 Optionally, the housing for the GTLS is itself  
17 placed into a chamber of an outer casing having at  
18 least one optically transparent or translucent  
19 portion to permit transmission of the luminescence  
20 from the tritium source. The outer casing  
21 facilitates easy handling of the housing which is  
22 generally small and also acts as a suitable  
23 receptacle for holding any light filter required.  
24 The outer casing is typically formed from metal,  
25 preferably stainless steel, although other  
26 materials (e.g. brass, aluminium, plastics,  
27 ceramics etc) can also be used. The transparent or  
28 translucent end is suitably formed from glass or  
29 plastic. Optionally the transparent or translucent  
30 end comprises a neutral density filter.  
31

1 The luminescent device may comprise colouring means  
2 to alter the colour of the light output to produce  
3 a coloured light output.

4  
5 Typically the GTLS comprises 10 to 20 mCi of  
6 tritium, suitably 15 to 20 mCi, preferably 18 mCi  
7 (0.666 GBq) of tritium. A suitable GTLS for use in  
8 the present invention is available commercially  
9 from mb-microtec ag (Niederwanger, Switzerland).

10  
11 In one embodiment the luminescent device according  
12 to the invention is sized and shaped to fit within  
13 a well in a well plate or the like. In this  
14 embodiment, the GTLS will normally be located  
15 within an inner housing which itself will be  
16 located within an outer casing. For convenience of  
17 handling (and especially removal of the device for  
18 the well) the outer casing will be of a magnetic  
19 material, such as steel. Optionally, the GTLS is  
20 located within the inner housing in a snug fit, so  
21 that the ends of the GTLS are not able to emit  
22 light and this improves the accuracy of the device  
23 for calibration or comparative purposes. The GTLS  
24 will typically be 4.5 mm x 1.6 mm.

25  
26 In an alternative embodiment the GTLS may be fixed  
27 within a single housing and an array of filters  
28 spaced along the length of the GTLS. Conveniently  
29 the filters will be arranged in order of optical  
30 density. In this embodiment, the array of filters  
31 in a single device facilitates calibration of a  
32 microscope or CCD camera, and use of a single light

1 source ensures calibration across the different  
2 filters.

3

4 In a further embodiment a scalebar graticule may be  
5 etched onto a filter so that the device may be used  
6 for measurement, typically of a sample viewed by a  
7 microscope or CCD camera. Photolithography may be  
8 used to manufacture the scalebar and the scale may  
9 be shown in mm or  $\mu\text{m}$  depending upon the apparatus.

10

11 According to a further aspect of the present  
12 invention there is provided a kit comprising two or  
13 more luminescent devices as described above, each  
14 providing a light output of pre-determinable and  
15 distinct intensity. Thus each of the luminescent  
16 devices provides a light output of a different pre-  
17 determinable intensity to the other devices present  
18 in the kit, and suitably the different intensities  
19 provided span the entire range of light intensity  
20 measurable by the scientific apparatus.

21

22 Optionally, the kit comprises 3, 4, 5, 6, or more  
23 devices, for example may contain 10, 12, 15 or 20  
24 devices.

25

26 The kit may also include indicia recording the  
27 date(s) of manufacture of the devices, and means to  
28 calculate the intensity of the light output at any  
29 time from the date(s) of manufacture.

30

31 In some embodiments it may be desirable for the  
32 device of the present invention to include a

1 magnetic component. The presence of a magnetic  
2 component allows the use of a magnetic handling  
3 tool and is especially useful for facilitating  
4 removal of small devices of the present invention  
5 from wells, such as from the well of a 96 well  
6 plate. Conveniently the magnetic component may be  
7 provided by use of an outer casing of a magnetic  
8 material such as steel.

9  
10 The kit may also comprise colouring means to alter  
11 the colour of the light output. Suitably the light  
12 output of each luminometer calibration device is  
13 altered by the colouring means, to a different  
14 colour, and the kit provides a range of coloured  
15 light outputs.

16  
17 Preferably the colouring means comprises one or  
18 more phosphors. Suitably the colouring means is  
19 provided by a phosphor coating on the GTLS housing.

20  
21 According to a further aspect of the present  
22 invention there is provided a colourimetric  
23 equipment calibration device having a luminescent  
24 sample comprising GTLS which provides a light  
25 output of pre-determinable intensity and colouring  
26 means to alter the colour of the light output to  
27 produce a coloured light output.

28  
29 According to a further aspect of the present  
30 invention there is provided a method of calibrating  
31 light measuring apparatus, comprising the steps of;

32

1 placing a luminescent device comprising  
2 gaseous tritium light source (GTLS) which  
3 provides a light output of pre-determinable  
4 intensity in the apparatus; and  
5  
6 adjusting the reading of light output of the  
7 apparatus to the pre-determined intensity of  
8 the light output of the luminescent device.  
9

10 Where the luminescent device comprises colouring  
11 means to alter the colour of the light output to  
12 produce a coloured light output, the apparatus  
13 tested may be colourimetric equipment.  
14

15 According to a further aspect of the present  
16 invention there is provided a light measuring  
17 apparatus comprising a luminescent calibration  
18 device comprising GTLS, wherein the luminescent  
19 calibration device is housed in a sample holder of  
20 the apparatus.  
21

22 According to a further aspect of the present  
23 invention there is provided a method of analysing a  
24 sample, said method comprising the steps of;  
25 i) calibrating an apparatus able to detect light  
26 output using a device as described above;  
27 ii) inserting said sample into the calibrated  
28 apparatus and obtaining a reading therefor.  
29

30 The sample may be any suitable sample comprising  
31 molecules and/or living cells. Usually the  
32 apparatus will be able to quantify the light output

1 reading and may be for example, a luminometer, a  
2 fluorometer, a spectrophotometer, a scintillation  
3 counter, a photomultiplier, a photodiode (like an  
4 avalanche photodiode) or a CCD camera. The method  
5 may be applicable for techniques including drug  
6 discovery, high throughput screening (especially  
7 using a light reporter), molecular biology and  
8 diagnostic applications, but other uses are not  
9 excluded.

10

11 The present invention will now be described by way  
12 of example only with reference to the accompanying  
13 drawings in which;

14

15 Figure 1 show a side view of a GLTS insert within  
16 an inner housing formed from a material such as  
17 aluminium, brass, plastics or the like.

18

19 Figure 2 shows a cross-sectional side view of the  
20 inner housing containing the GLTS of Fig.1.

21

22 Figure 3 shows a perspective view of the inner  
23 housing of Figs. 1 and 2.

24

25 Figure 4 shows the light output from the device of  
26 Figs. 1 to 3.

27

28 Figure 5 is a cross-sectional view of a device  
29 according to the invention having the housing of  
30 Figs. 1 to 4 located within an outer casing and  
31 with a filter located thereon.

32

1     **Figure 6** is a cross-sectional view of an outer  
2     housing for a device according to the present  
3     invention modified for 384 well plates.

28    array for use in the device of Figs. 10 to 12.

29  
30    **Figure 14** shows a longitudinal cross-section of  
31    device according to the present invention for use

1 in a self-luminescence scale bar or graticule  
2 calibration device.

3

4 Figure 15 shows a lateral cross-section of the  
5 device according to Fig. 14.

6

7 Figure 16 shows a top view of the device according  
8 to Fig. 14.

9

10 Figure 17 shows an exemplary scale bar graticule  
11 filter which may be used in the device of Figs. 14  
12 to 16.

13

14 Figure 18 shows data from three luminescent devices  
15 according to the present invention over a 24 hour  
16 period measured using a Mithras LB 940 luminometer  
17 (Berthold).

18

19 Figures 19 to 23 illustrate laser etching of  
20 luminescent devices according to the present  
21 invention.

22

23 Figure 24 shows a longitudinal cross-section of a  
24 magnetic handling tool suitable for handling  
25 luminescent devices of the present invention.

26

27 Figure 25 shows a lateral cross-section through  
28 line A-A in Fig. 24.

29

30 Figure 26 is a photograph of three luminescent  
31 devices according to the present invention. Well  
32 A1 corresponds to calibration device A of Fig. 18;

1 Well A2 corresponds to device B in Fig. 18 and Well  
2 A3 corresponds to the device C in Fig. 18.

3

4 With reference to the Figures, Figures 1 to 5 show  
5 an exemplary luminescent device according to the  
6 present invention designed for use in 96 well  
7 plates. The luminescent device (1) is constructed  
8 with an outer casing (6) constructed from stainless  
9 steel (416). The outer casing is susceptible to a  
10 magnetic field which enables the device to be  
11 easily extracted from the 96 well plate using a  
12 magnetic handling tool (for example as shown in  
13 Figures 24 and 25). The gaseous tritium light  
14 source (GSLs) (3) is fixed in place within an inner  
15 housing (2) using a silicon based adhesive. An  
16 aperture (4) in the top of housing (2) allows light  
17 to be admitted (see arrows at Figure 4) and since  
18 the aperture is of a given diameter this means that  
19 the light output is uniform. The GTLS (3) within  
20 the housing (2) as shown in Figures 1 to 4 may be  
21 located within the outer casing (6) using an  
22 adhesive. A filter (5) formed of glass or other  
23 material is then secured across the aperture (4)  
24 for example using adhesive. The filter (5) can be  
25 of different optical density and exemplary filters  
26 include neutral density filters of 1.0 giving 10%  
27 transmission, neutral density filter of 2.0 giving  
28 1% transmission of neutral density filter of 3.0  
29 giving 0.1% transmission. Coloured filters may  
30 alternatively be used to filter what light of a  
31 specific wavelength.

32

1 An alternative embodiment of the present invention  
2 is shown in Figures 6 and 7 and illustrator  
3 modified design for the luminescent device for a  
4 394 well plate. Figure 6 shows an outer cases (6)  
5 which may conveniently be formed of magnetic metal,  
6 such as stainless steel. The size of the outer  
7 casing will be selected for insertion into an  
8 individual well of a 384 well plate but typically  
9 the length of the casing shown in Figure 6 would be  
10 approximately 9mm. Figure 7 illustrates the formed  
11 device with the GTLS 3 being prelocated into a  
12 tubular housing (2) which may for example be  
13 aluminium. One end of the tubular housing (2)  
14 maybe sealed using a suitable sealant, for example  
15 silicon glue (8). The opposite end of the inner  
16 housing (2) may be sealed with a transparent or  
17 translucent material (9) for example glass, such as  
18 sapphire glass. A glass filter (5) is placed over  
19 the free end of the inner housing such that light  
20 is emitted through aperture (7) of the outer casing  
21 (6).

22  
23 An alternative embodiment of luminescent device  
24 according to the present invention is illustrated  
25 in Figure 9 and is suitable for use in PCR or  
26 conical well plates. An outer housing (6) is shown  
27 in Figure 8 and again an inner housing (2) similar  
28 to that illustrated in Figures 1 to 4 is present  
29 and contains the GTLS (3) a filter (5) is located  
30 over the top of the inner housing (2) and light is  
31 emitted through apertures (4) and (7).

32

1 Figures 10 to 13 illustrate a luminescent device  
2 according to the present invention designed for  
3 calibration of a microscope, CCD camera or other  
4 imaging system. In this embodiment the GTLS kit  
5 (3) is located within an inner housing (2) and is  
6 secured therein either through the internal size  
7 and shape of the inner housing (2) and/or through  
8 the use of an adhesive. A filter (5) is located  
9 over the GTLS. An exemplary filter having an array  
10 of different neutral densities thereon is  
11 illustrated in Figure 13 and demonstrates the  
12 option of having different light outputs with a  
13 single GTLS lightsources. At each end of the  
14 neutral density filter array is a small bar (10 and  
15 10') in which the light is not filtered for  
16 comparative purposes.

17  
18 Figures 14 to 17 illustrate an alternative  
19 embodiment of the present invention in which the  
20 luminescent device can be used as a self  
21 luminescence scale bar or graticule calibration  
22 device. The longitudinal cross section, lateral  
23 cross section and top view are similar to those of  
24 Figures 10, 11 and 12, but Figure 17 shows an  
25 alternative exemplary filter in which a scale bar  
26 graticule has been etched thereon using lithography  
27 or mask techniques (similar to those used during  
28 production of a semi-conductor chip) and in which  
29 the scale can be selected from millimetres to  
30 micrometers.

31

1 Figure 18 shows data from a calibration device over  
2 24 hours measured using a Mithras LB 940  
3 luminometer (Berthold). Three different devices  
4 according to the present invention were measured,  
5 each having a different density filter thereon.  
6 The devices are labelled A, B and C in the graph.  
7 Each device was measured for 0.1 seconds, at 360  
8 second intervals over 24 hours. The average  
9 intensity of calibration device A was 1011763  
10 relative light units (RLU); B equals 99163 RLU and  
11 C equals 27326 RLU.

12  
13 Figures 19 to 23 illustrate the option of laser  
14 etching a luminescent device according to the  
15 present invention. Each device is labelled with  
16 the product type and with a unique serial number.  
17 Such labelling allows the luminescent device to the  
18 calibrated manufacture and to trace throughout its  
19 lifetime.

20  
21 Figures 24 and 25 illustrate an exemplary magnetic  
22 handling tool for extracting luminescent devices  
23 according to the present invention and having a  
24 magnetic component within their manufacture from  
25 well plates, for example from 96 or 384 well  
26 plates. In the exemplary magnetic handling tool a  
27 neodymium disk magnet is fixed into a magnetic rod.  
28 Other magnet types could alternatively be used.

29  
30 Figure 26 illustrates the devices according to the  
31 present invention (the devices as illustrated in  
32 Figure 18) in use in a 96 well plate. In sample A1

18

1 (corresponding to sample A of Figure 18) the light  
2 intensity of the GTLS is strong and the GTLS is  
3 clearly visible. In sample A2 (corresponding to  
4 sample B in Figure 18) a greater degree of  
5 filtering has been applied and in sample A3  
6 (corresponding to sample C in Figure 18) the  
7 filtering has again been increased.

1     Claims

2

3     1.    A luminescent device comprising a gaseous  
4           tritium light source (GTLS) which provides a  
5           light output of pre-determinable intensity.

6

7     2.    A device according to Claim 1, wherein the GTLS  
8           comprises 10 to 20 mCi of tritium.

9

10    3.    A device according to either one of Claims 1  
11          and 2, wherein the GTLS is located with an  
12          outer casing having at least one optically  
13          transparent or translucent portion.

14

15    4.    A device according to Claim 3, wherein the  
16          outer casing is steel.

17

18    5.    A device according to either one of Claims 3  
19          and 4, wherein the transparent or translucent  
20          portion comprises a neutral density filter.

21

22    6.    A device according to any one of Claims 3 to 5,  
23          wherein the transparent or translucent portion  
24          is formed from glass or plastic.

25

26    7.    A device according to any one of Claims 1 to 6,  
27          wherein the device further comprises colouring  
28          means to alter the colour of the light output  
29          of the GTLS.

30

- 1      8.    A device according to any one of Claims 1 to 7,  
2            wherein the GTLS is held within a housing, the  
3            housing being located in the outer casing.  
4
- 5      9.    A device according to any one of Claims 1 to 8,  
6            which is sized and shaped to calibrate the  
7            optical output of scientific apparatus.  
8
- 9      10.   A device according to Claim 9, wherein said  
10           apparatus is a luminometer, a fluorometer, a  
11           spectrophotometer, a scintillation counter, a  
12           photomultiplier, an avalanche photodiode or a  
13           CCD camera.  
14
- 15     11.   A device according to any one of Claims 1 to 8,  
16           wherein said device comprises a scalebar  
17           graticule.  
18
- 19     12.   A device according to any one of Claims 1 to 8,  
20           wherein said device comprises a filter array.  
21
- 22     13.   A kit comprising two or more luminescent  
23           devices according to any one of Claims 1 to 12,  
24           each said device providing a light output of a  
25           distinct intensity to the other devices of said  
26           kit.  
27
- 28     14.   A kit according to Claim 13, further comprising  
29           a magnetic handling tool and wherein each said  
30           device includes a magnetic component.  
31

- 1     15. A kit according to either one of Claims 12 and  
2       13, comprising three or more devices, each  
3       having a light output of a distinct intensity  
4       to the other devices of said kit.  
5
- 6     16. A light measuring apparatus comprising a  
7       luminescent device as claimed in any one of  
8       Claims 1 to 12, housed in a sample holder of  
9       said apparatus.  
10
- 11    17. An apparatus as claimed in Claim 16, which is a  
12       luminometer, a fluorometer, a  
13       spectrophotometer, a scintillation counter, a  
14       photomultiplier, an avalanche photodiode or a  
15       CCD camera.  
16
- 17    18. A method of analysing a sample, said method  
18       comprising;  
19       i)    calibrating an apparatus able to detect  
20           light output using a device as claimed in  
21           any one of Claims 1 to 12;  
22       ii)   inserting said sample into the calibrated  
23           apparatus and obtaining a reading  
24           therefore.  
25
- 26    19. A method as claimed in Claim 18, wherein the  
27       sample comprises living cells.
